### Related Procedures

- ▶ ASTM C31 – Practice for Making and Curing Concrete Test Specimens in the Field
- ▶ ASTM C138 – Test Method for Density (Unit Weight), Yield, and Air Content (Gravimetric) of Concrete
- ▶ ASTM C172 – Practice for Sampling Freshly Mixed Concrete
- ▶ ASTM C173 – Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method
- ▶ ASTM C231 – Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method
- ▶ ASTM C670 – Practice for Preparing Precision and Bias Statements for Test Methods for Construction Materials
- ▶ ASTM D638 – Test Method for Tensile Properties of Plastics

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Scope

- ▶ This test method addresses the procedures for determining the slump of hydraulic-cement concrete.
- ▶ The slump test can be conducted both in the field and laboratory.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Summary of Test Method

- ▶ A sample of concrete is placed in a mold and consolidated.
- ▶ The mold is then raised vertically and the concrete is allowed to settle.
- ▶ Slump is the vertical distance between the original and displaced center of the concrete surface.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Significance and Use

- ▶ This test is considered applicable to concrete having coarse aggregate up to 37.5 mm in size.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Significance and Use

- ▶ When the aggregate is larger than 37.5 mm,
  - wet sieve the concrete over a 37.5 mm sieve
  - test the sieved material

Note that the standard does not state whether the aggregate size is an absolute maximum or nominal maximum.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Significance and Use

- ▶ This test is NOT applicable to non-plastic, non-cohesive concrete.
  - non -plastic concrete is defined as having a slump less than 15 mm
  - non-cohesive concrete is defined as having a slump greater than about 230 mm

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Significance and Use: Note 1

- ▶ The slump test was originally devised to provide a method to monitor the consistency of unhardened concrete.
- ▶ Under field conditions a relationship between slump and strength cannot be clearly and consistently shown.

---

---

---

---

---

---

---

---

### Apparatus

- ▶ Mold
- ▶ Tamping Rod
- ▶ Measuring Device
- ▶ Scoop

www.CTLGroup.com

---

---

---

---

---

---

---

---

### Apparatus: Mold

- ▶ May be metal or an alternate material.

www.CTLGroup.com

---

---

---

---

---

---

---

---

**Apparatus: Mold**

- ▶ Shall be in the shape of the frustum of a cone.
  - 100 mm wide top, 200 mm wide base, 300 mm height
- ▶ Dimensions shall be checked and recorded,
  - when purchased or first used
  - at least annually
- ▶ Shall have foot fins and handles.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

**Apparatus: Alternate Material Molds**

- ▶ Non-metal molds are permissible if they,
  - meet the shape and dimensional requirements of metal molds
  - are rigid, dimensionally stable, resistant to impact, and non-absorbent
  - provide results comparable to metal molds
- ▶ Initial comparability tests are the responsibility of the manufacturer.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

**Apparatus: Alternate Material Molds**

- ▶ If the condition of a mold is suspected of being out of tolerance from the as manufactured condition,
  - perform a single comparative test with a metal mold
  - the difference in measured slump between the metal and alternate material mold may not be more than 15 mm
  - molds that fail the test shall be removed from service

www.CTLGroup.com 

---

---

---

---

---

---

---

---

**Apparatus: Tamping Rod**

- ▶ Round, smooth, straight, steel.
- ▶ 16 mm diameter.
- ▶ Tamping end, or both ends, shall be rounded to a hemispherical tip.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

**Apparatus: Tamping Rod**

- ▶ The length shall be at least 100 mm greater than the depth of the mold, but not greater than 600 mm.
  - a length of 400 to 600 mm meets these requirements

www.CTLGroup.com 

---

---

---

---

---

---

---

---

**Apparatus: Measuring Device**

- ▶ Ruler, roll-up tape, or similar device.
- ▶ Rigid or semi-rigid.
- ▶ Marked with increments of 5 mm or smaller.
- ▶ Minimum length of 300 mm.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Apparatus: Scoop

- ▶ Shall have a size,
  - large enough so the material taken from the sampling receptacle is representative
  - small enough so concrete is not spilled during placement of material in the mold

www.CTLGroup.com

---

---

---

---

---

---

---

---

### Procedure: Sample

- ▶ Obtain a representative sample of concrete according to ASTM Practice C 172.

www.CTLGroup.com

---

---

---

---

---

---

---

---

### Procedure: Dampen Mold

- ▶ Dampen the mold and place on a rigid, flat, level, moist, and non-absorbent surface that is free of vibration.

www.CTLGroup.com

---

---

---

---

---

---

---

---

**Procedure: Secure Base**

- ▶ Stand on the two foot fins while filling the mold and cleaning the perimeter.
  - clamping the mold to a base is also permitted

www.CTLGroup.com 

---

---

---

---

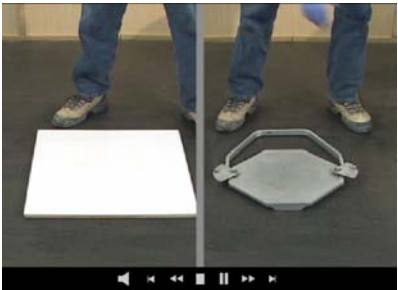

---

---

---

---

**Procedure: Secure Base**

www.CTLGroup.com 

---

---

---

---

---

---

---

---

**Procedure: Filling Mold**

- ▶ Use a scoop to place concrete in the mold.
- ▶ Move the scoop around the mold opening so material is evenly distributed and segregation is minimized.
- ▶ Fill the mold in three layers of approximately equal volume.
  - fill the mold to 70 mm, 160 mm, and then 300 mm from the base

www.CTLGroup.com 

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Procedure: Rodding Concrete

- ▶ Rod each layer 25 times.
  - uniformly distribute the rodding strokes over the cross section of a layer
  - rod the bottom layer through its depth
  - rod each upper layer through its depth and into the layer below approximately 25 mm

The CTI GROUP logo and website URL are at the bottom.

---

---

---

---

---

---

---

---

### Procedure: Rodding Concrete

- ▶ While rodding the bottom layer,
  - slightly incline the rod
  - rod around the mold perimeter using about half of the 25 strokes
  - conclude with vertical strokes near the center of the mold
- ▶ For the top layer,
  - heap concrete above the mold prior to rodding
  - add concrete as necessary to keep an excess above the top of the mold at all times

The photograph shows a person's hands using a metal rod to compact concrete in a circular mold. The mold is placed on a wooden stool. The CTI GROUP logo and website URL are at the bottom.

---

---

---

---

---

---

---

---

### Procedure: Rodding Concrete

www.CTLGroup.com

---

---

---

---

---

---

---

---

### Procedure: Strike-off Concrete

- ▶ Strike-off the mold with the tamping rod in a screeding and rolling motion.

www.CTLGroup.com

---

---

---

---

---

---

---

---

### Procedure: Raising the Mold

- ▶ Holding the mold down firmly, clear away any concrete from the area surrounding the base.
  - prevent interference with the slumping concrete
- ▶ Remove the mold immediately after clearing the base of concrete.
- ▶ Raise the mold vertically in  $5 \pm 2$  seconds.
  - there should be no lateral or torsional (twisting) motion

www.CTLGroup.com

---

---

---

---

---

---

---

---

Procedure: Raising the Mold

www.CTLGroup.com 

---

---

---

---

---

---

---

---

Procedure: Timing Requirements

- ▶ Complete the entire test without interruption, from the start of filling to removal of the mold, within 2½ minutes.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

Procedure: Measuring Slump

- ▶ When measuring the slump,
  - measure immediately after removing the mold
  - measure the vertical difference between the top of the mold and the displaced original center
  - if a falling away or shearing occurs, disregard the test and make a new test using another portion of the sample

To measure slump, it is convenient to invert the mold and place it next to the slumped concrete.

---

---

---

---

---

---

---

---

---

### Report

- ▶ Slump is reported to the nearest 5 mm.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Limitations and Errors

- ▶ Slump test is suitable for slumps of medium workability, slump in the range of 15 – 230 mm.
- ▶ Test fails to determine the difference in workability in stiff mixes which have zero slump, or for wet mixes that give a collapse slump.
- ▶ Limited to concrete formed of aggregates of less than 37.5 mm
- ▶ Lacks to tell you anything about water content, w/c, w/cm, strength, air, shrinkage, pump-ability, response to the vibrator and slip forms, and finishability.
- ▶ User dependent.
- ▶ Very sensitive to time from mixing and time in cone.

www.CTLGroup.com 

---

---

---

---

---

---

---

---

### Factors Affecting Slump

1. Content, proportions, chemistry, fineness, particle size distribution, moisture content and temperature of cementitious;
2. Content, proportions, size, texture, combined grading, shape, fineness and moisture content of the aggregates;
3. Dosage, type, combination, interaction, sequence of addition, effectiveness of chemical admixtures;
4. Air content;
5. Batching, mixing and delivery method and equipment;
6. Temperature of the concrete;
7. Sampling, slump-testing technique and the condition of test equipment;
8. The amount of free water in the concrete; and
9. Time since batching at the time of testing.
